# Week 3

LeftOver Relational Algebra

### First lab

• Today (Monday Sept 27<sup>th</sup>) – 4:30 – 5:20pm – on zoom

• Link on Courselink

- Select
- Project
- Join
  - Cartesian product
  - Natural join
  - Theta join
  - Outer joins
- Divide by
- Set operators

#### Movies:

| mID | title             | director | year | length |
|-----|-------------------|----------|------|--------|
| 1   | Shining           | Kubrick  | 1980 | 146    |
| 3   | Chinatown         | Polaski  | 1974 | 131    |
| 5   | Star Wars IV      | Lucas    | 1977 | 126    |
| 6   | American Graffiti | Lucas    | 1973 | 110    |

Note that I have changed the instance of table movies to demo the next operator we learn.

List all actors who play a role in every movie listed in the database.

#### Artists:

| alD | aName     | nationality |
|-----|-----------|-------------|
| 1   | Nicholson | American    |
| 2   | Ford      | American    |
| 3   | Stone     | British     |
| 4   | Fisher    | American    |
| 5   | Bachchan  | Indian      |

#### Roles:

| mID | alD | character            |
|-----|-----|----------------------|
| 1   | 1   | Jack Torrance        |
| 3   | 1   | Jake 'J.J.' Gittes   |
| 1   | 3   | Delbert Grady        |
| 5   | 1   | Han Solo             |
| 6   | 1   | Bob Falfa            |
| 5   | 4   | Princess Leia Organa |

### Division operator

- Division is a binary operator which returns a relation
  - with all the attributes of R that are not attributes of S
  - with all the tuples from R that "match" every tuple in S
- Notation: R ÷ S
  - every attribute of S must be an attribute of R

### Division

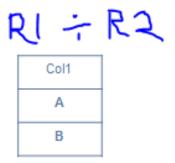

Note that to divide R1 by R2, every attribute in R2 must be an attribute in R1

• Example

| Col1 | Col2 |
|------|------|
| А    | 1    |
| А    | 2    |
| В    | 1    |
| В    | 2    |
| С    | 1    |

Col2 1 2

R2

#### Movies:

| mID | title             | director | year | length |
|-----|-------------------|----------|------|--------|
| 1   | Shining           | Kubrick  | 1980 | 146    |
| 3   | Chinatown         | Polaski  | 1974 | 131    |
| 5   | Star Wars IV      | Lucas    | 1977 | 126    |
| 6   | American Graffiti | Lucas    | 1973 | 110    |

List all actors who play a role in every movie listed in the database.

#### Artists:

| alD | aName     | nationality |
|-----|-----------|-------------|
| 1   | Nicholson | American    |
| 2   | Ford      | American    |
| 3   | Stone     | British     |
| 4   | Fisher    | American    |
| 5   | Bachchan  | Indian      |

#### Roles:

| mID | alD | character            |
|-----|-----|----------------------|
| 1   | 1   | Jack Torrance        |
| 3   | 1   | Jake 'J.J.' Gittes   |
| 1   | 3   | Delbert Grady        |
| 5   | 1   | Han Solo             |
| 6   | 1   | Bob Falfa            |
| 5   | 4   | Princess Leia Organa |

## Set operations

- Because relations are sets, we can use set intersection, union and difference.
- Relations must be Union Compatible: Two relations R(A1,...An) and S(B1,...Bn) are said to be *Union Compatible* if they have the same degree n and Domain(Ai) = Domain(Bi) where 1≤i ≤n
- You can make 2 relations union compatible by projecting (∏) the desired attributes, before applying any set operator.

### Set operators

**R** US: is a relation that includes all tuples that are either in R or in S or in both R and S, duplicate tuples being eliminated.

**R**  $\cap$ **S**: is a relation that includes all tuples that are in both R and in S.

**R – S:** is a relation that includes all tuples that are in R but not in S.

#### Movies:

Artists:

aName

Ford

Stone

Fisher

Nicholson

alD

| mID | title             | director | year | length |
|-----|-------------------|----------|------|--------|
| 1   | Shining           | Kubrick  | 1980 | 146    |
| 2   | Player            | Altman   | 1992 | 146    |
| 3   | Chinatown         | Polaski  | 1974 | 131    |
| 4   | Repulsion         | Polaski  | 1965 | 143    |
| 5   | Star Wars IV      | Lucas    | 1977 | 126    |
| 6   | American Graffiti | Lucas    | 1973 | 110    |
| 7   | Full Metal Jacket | Kubrick  | 1987 | 156    |

names of actors who do not work in a movie with mID =

Roles

<1, 2>

#### Roles:

| ا | nationality |
|---|-------------|
| 4 | American    |
| 4 | American    |
|   | British     |
| 4 | American    |
|   |             |

| mID | alD | character            |
|-----|-----|----------------------|
| 1   | 1   | Jack Torrance        |
| 3   | 1   | Jake 'J.J.' Gittes   |
| 1   | 3   | Delbert Grady        |
| 5   | 2   | Han Solo             |
| 6   | 2   | Bob Falfa            |
| 5   | 4   | Princess Leia Organa |

### Relational algebra wrap-up

- Approaching the problem:
  - Ask yourself which relations need to be involved.
  - If an instance is given, use it to get results that tells you a lot the relations involved, operators required to get results etc.
  - Is there an intermediate relation that would help you get the final answer?
    - Draw it out with actual data in it.
    - Use assignment to define those intermediate relations.
  - Every time you combine relations, confirm that
    - attributes with same name will be made to match, unless otherwise stated in the design
    - Mostly, natural join will suffice when you join relations
    - If a self join is required, use cartesian product
    - Look for 'for all' or 'every' clause in the query that should give you a hint that you might need to use divideBy (÷)

### Relational Calculus

- Another abstract query language for the relational model.
- Based on first-order logic.
- RC is "declarative": the query describes what you want, but not how to get it.
- Queries look like this:
  { t | t ε Movies Λ t[director] = "Scott" }
- Expressive power (when limited to queries that generate finite results) is the same as RA. It is "relationally complete."

We will focus ONLY on RA for 3530 this term
